Red giant UNIVERSE 1.2.0 plugin.(English) - The Ultimate Adobe.A team of scientists has discovered a potential way to keep Alzheimer’s and other diseases at bay through stem cell treatments. A team of scientists has discovered a potential way to keep Alzheimer’s and other diseases at bay through stem cell treatments. Scientists said stem cells can be “reprogrammed” to transform into either nerve cells or glial cells, the ones that help neurons work. These cells act as a “back-up” team for neurons, which often die off during the aging process. In an experiment, scientists have tested what happens to brain cells in mice when stem cells are injected into their brains. As per the findings, neurons and glial cells that were born following stem cell injections continued to function normally and behaved exactly as they would do in the brain of a younger mouse. The result of this means that the brain retains its capacity to repair itself even after stem cell injections. The stem cell injections also showed positive results for the mice suffering from Alzheimer’s and neurodegeneration. The mice injected with stem cells that were healthy and closely resembled those born in a younger mice. According to the researchers, the next step of the study is to try the experiment on a “larger sample size” and then apply the treatment to people.Q: Dissolving a given graph into smaller isolated pieces We are given a graph $G = (V, E)$ where $\{u, v\} \in E$ and $|V| = n$. We are asked to show that there exists a list L of non-empty subsets $S_j \subseteq V$ for $j \in [k]$ such that $\forall i, j \in [k]: i \neq j \implies S_i \cap S_j = \emptyset$ S_j is a forest for all $j \in [k]$ (A forest is a set of connected graphs.) If we assume that the graph is not a tree, then it is clear that we have to decom
