The following solutions are accurate and proper when using logrotate Portable: Software Layer It's recommended to use logrotate Portable in combination with your

---

software layer (example: antivirus).  
Logrotate Portable is not a virus engine.  
Logrotate Portable is used to handle the rotation of logfiles. It does this in the background at any time you like. Local or Remote Logrotate Portable allows you to handle logfiles that are within your machine. Logrotate Portable is not a server or a remote handler. It's a local handler. Synchronous or Asynchronous Logrotate Portable allows you to handle logfiles that are within your machine.

---

You need to handle these logfiles in a synchronous way (which means that you have to wait until a logfile has been handled. You are no longer allowed to write to that logfile in your application). Logrotate Portable allows you to handle logfiles that are within your machine. You don't have to wait until a logfile is handled. You can immediately write to it (logrotate Portable handles the rotation of the logfile in the background without any interruption). The size of a logfile

---

can be the limiting factor on which you use Logrotate Portable. Logrotate Portable is not an asynchronous handler. Server Logrotate Portable allows you to handle logfiles that are within your machine. Logrotate Portable is a server. You need to connect to this server to handle your logfiles. Logrotate Portable uses a proxy to handle logfiles that are not within your machine. Storage Logrotate Portable is a local handler. It handles logfiles directly on your

---

filesystem. Mailing Logrotate Portable uses the standard sendmail/postmail systems (example: sendmail/postmail). If you like to mail your logfiles, you don't need to use Logrotate Portable. You can use any program you like that is compatible with these systems. Uninstallation

Uninstallation of logrotate Portable only removes the Windows system files (no files and registry entries are removed).
