Interpid is a new version of the popular free and open source package management tool known as PackageKit. I am here to give you a quick overview of the new features and then I will also cover it in detail and show you how to add, remove and update software packages to and from your local Linux repositories. Contents Introduction Interpid is a new version of the popular free and open source package management tool known as PackageKit. I am here to give you a quick overview of the new features and then I will also cover it in detail and show you how to add, remove and update software packages to and from your local Linux repositories. History of PackageKit PackageKit is a simple software toolkit for managing software packages in Linux. The basic idea behind PackageKit is to provide a low level interface which makes software package management much easier and more user friendly. The goal of PackageKit is to replace the current software selection applications such as Add/Remove Software and Synaptic. A quick overview of the current development process for PackageKit is that a new version is released every two months. Installation and Setup PackageKit is easy to setup. First, we need to make sure that we have all the required dependencies installed. Once this is complete, we can then install PackageKit. The following are the three commands you will need to run: `sudo apt-get install pkgnames python-dev libk3b2-mp3 python-support python-central libgdome2-0 libc6` Now that PackageKit is installed, you will need to make sure that the path to PackageKit is set. To do this, you will need to log out and log back in. Once you are back in, you will need to run the following command: `export PKGNAMES_PATH=/usr/share/pkgnames/` We are now ready to start using PackageKit. You can access PackageKit at the following location: 1. Logging in to PackageKit We first need to log in to PackageKit to access the user interface. To log in, simply use the following command: `python -c "import dbus,glib;dbus.init();glib.init();dbus.MainLoop().run()"` Once PackageKit has started, you should see something similar to the following: This is the main PackageKit user interface. At the top, you will see the Menu bar which is split into the following sections: Searching Add/Remove Updates Installed Installed Updates Local The first section is the Menu bar, which includes: Searching Add/Remove Updates Installed Installed Updates Local The top one allows you

Video Settings: Audio Settings: The patch version numbers were just added to the patch which happened to coincide with the latest PCSX2 update for v0.8.2. Since this is a small patch there isn't really a need to update the PCSX2 patch to the newest version of PCSX2. So I updated my PCSX2 and all the plugins were updated and working as of v0.8.2. If you haven't already made sure to update your PCSX2 and all plugins in the version
